UI Bugs

1. I simplified the home screen to reduce clutter and kept it to mainly text for the shop title and various pages.
2. I reformatted the product detail page and made the glaze option a dropdown menu and the number of buns a series of radio buttons. This is a more intuitive option because dropdown menus are a lot more common.
3. I thought that simplifying / consolidating the cart colors would make the visual distinction between the cart and order form easier to see, and less confusing because there are no extra lines and busy design elements cluttering up the screen.

Challenges

In the product page I had a lot of issues with overlapping elements in grids. I ended up restructuring how I coded the grid and using margin padding to center the names over the photos. Additionally, I had issues with aligning the elements in the header (title and nav)- which again I restructured to a series of links and text in the same div container.

Brand Identity

I coded a website for a bakery that sells cinnamon buns. Taking that into account, I wanted to make a brand identity that was modern, but not sterile- something that gave the viewer a sense of coziness that evoked the idea of a bakery. I went with a color scheme similar to the colors of a cinnamon buns like deep browns and ochre colors. I tried to add a lot of pictures of cinnamon buns as well, to give the viewers a good visual experience.
